

Sodium valproate and pregnancy

What do I need to know?

Important information for girls and young women taking sodium valproate

- Please read this information carefully and keep it somewhere safe so that you can read it again. You may want to discuss it with your friends or family.
- Further information about how to take sodium valproate can be found on www.medicinesforchildren.org.uk/sodium-valproate-preventing-seizures

Sodium valproate is a highly effective medicine for the treatment of epilepsy.

- It is vital that you do not become pregnant while taking sodium valproate because it can harm a developing baby.
- You can discuss contraception with your doctor, epilepsy team, or family planning services – make sure they know that you are taking sodium valproate.
- If there is any chance you might be pregnant, contact your doctor or nurse as soon as possible.
- Do not stop taking sodium valproate, as you may have more seizures.
- Sodium valproate is also known as valproic acid and by the brand names Convulex, Epilim, Epilim Chrono, Epilim Chronosphere, Episenta, Epival and Orlept.

Why mustn't I become pregnant while taking sodium valproate?

Sodium valproate can cause physical harm to a developing baby.

- The baby may develop spina bifida, in which the spine does not develop properly.
- The face and skull may not form properly, resulting in cleft lip and palate.
- The arms and legs, heart, kidneys, urinary tract and sex organs may not develop properly.

The baby may also have developmental problems after birth.

- Their development may be delayed, so that they walk or talk later than would be expected.
- They may have low intelligence, memory problems, or poor language skills, with difficulty in speaking and understanding.
- They may have an increased risk of childhood autism spectrum disorders and attention deficit hyperactivity disorder (ADHD).

How do I make sure that I don't become pregnant?

- If you are sexually active, it is vital that you use contraception to protect against becoming pregnant.
- You can discuss contraception with your epilepsy team, your doctor or family planning services.
- You are at risk of becoming pregnant even if you don't have periods, so it is vital that you use contraception when having sex.

What should I do if I think I might be pregnant?

- Talk to an adult you trust and contact your doctor or nurse straightaway for advice and support.
- Continue to take your medicine in the meantime.

Can I take a different medicine?

- Several medicines are used to treat epilepsy of different types; however, some of these may also have harmful effects on developing babies.
- You should discuss your medicine with your healthcare team.

Who to contact for more information
